

## One-Page Summary: Wartime Drafting and Bureaucratic Labor Reallocation in Tokyo

### 1) Research Question

- How does a large bureaucracy replace workers lost to military conscription?
- Is adjustment primarily internal reallocation or external hiring?
- Do draft shocks increase female representation?

### 2) Approach

- Novel administrative panel of wartime Tokyo civil servants across offices, positions, and years.
- Office–position draft exposure regressions with section, position, and year fixed effects, validated by pre-war balance checks.
- Tracks transfers, hires, promotions, bonus pay, retention, and postwar careers.

### 3) Findings

- Per draft exit: about **0.41 internal transfers** vs **0.22 new hires**; moves are mostly across sections/bureaus.
- Offices also promote incumbents (~8.7 pp per draft) and expand bonus allowances to retain staff.
- Replacement is largely male; draft exposure does not significantly raise office female share.
- Transferees have better later retention/advancement, but this is descriptive (non-random selection may remain).

### 4) Contributions

- Provides rare micro-level evidence on wartime public-sector internal labor markets.
- Shows centralized internal redeployment is the dominant replacement margin.
- Nuances wartime gender narratives: female entry reflects broader labor-demand expansion more than direct draft substitution.

### 5) Future Directions

- Compare these draft-driven staffing responses against manager displacement caused by military bombing during the Tokyo air raids.
